

WEEK 7 TESTING FINDINGS

The testing activities provide evidence across several dimensions:

1. Performance

The refined model was evaluated using held-out test data and cross-validation.

2. Error Behaviour

False positives and false negatives were explicitly identified and reviewed.

3. Generalisation

Training performance was compared with held-out test performance and cross-validation results.

4. Robustness

The preprocessing pipeline was tested using simulated missing and unseen input values.

5. Threshold Behaviour

Multiple thresholds were evaluated to understand the precision/recall trade-off.

6. Business Relevance

Predicted probabilities were converted into descriptive risk bands to examine whether higher predicted risk corresponded with a greater observed concentration of No-Shows.

These results should be interpreted using the actual values produced by the notebook.
